

# Package ‘SafeQuant’

December 6, 2016

**Type** Package

**Title** A Toolbox for the Analysis of Proteomics Data

**Version** 2.3.2

**Date** 2016-12-06

**Author** Erik Ahrne

**Maintainer** Erik Ahrne <erik.ahrne@unibas.ch>

**Description** Tools for the statistical analysis and visualization of (relative and absolute) quantitative (LFQ,TMT,HRM) Proteomics data.

**Imports** limma,

gplots,  
seqinr,  
corrplot,  
optparse,  
data.table,  
epiR,  
Biobase,  
ggplot2,  
magrittr

**License** GPL-3

**RoxygenNote** 5.0.1

## R topics documented:

|                                      |    |

|---------------------------|--|
| <code>addIdQvalues</code> | <i>Add identification leve q-values to ExpressionSet (calculated based on target-decoy score distribution)</i> |
|---------------------------|--|

---

## Description

Add identification leve q-values to ExpressionSet (calculated based on target-decoy score distribution)

## Usage

```
addIdQvalues(eset = eset)
```

## Arguments

|                   |               |
|-------------------|---------------|
| <code>eset</code> | ExpressionSet |
|-------------------|---------------|

## Details

if ptm column is part if the ExpressionSet q-values are calculated seperately for modified and non-modified features

No details

## Value

ExpressionSet object

## Note

No note

**See Also**[getIdLevelQvals](#)**Examples**

```
print("No examples")
```

---

`addScaffoldPTMFAnnotations`*Add scaffold ptm annotaitons to tmt experiment*

---

**Description**

Add scaffold ptm annotaitons to tmt experiment

**Usage**

```
addScaffoldPTMFAnnotations(eset, file)
```

**Arguments**

|                   |                       |
|-------------------|-----------------------|
| <code>eset</code> | ExpressionSet         |
| <code>file</code> | path to Scaffold file |

**Value**

ExpressionSet object

**Note**

No note

**References**

No references

**Examples**

```
print("No examples")
```

---

barplotMSSignal*Barplot of ms-signal per column*

---

**Description**

Barplot of ms-signal per column

**Usage**

```
barplotMSSignal(eset,  
  col = as.character(.getConditionColors(eset)[pData(eset)$condition, ]),  
  method = c("sum", "sharedSignal"), cex.lab = 1.25, cex.axis = 1.25,  
  cex.names = 0.9, labels = rownames(pData(eset)), ...)
```

**Arguments**

|           |                                  |
|-----------|----------------------------------|
| eset      | expressionSet                    |
| col       | default condition colors         |
| method    | c("median","sum","sharedSignal") |
| cex.lab   | default 1.25                     |
| cex.axis  | default 1.25                     |
| cex.names | default 0.9                      |
| labels    | labels                           |
| ...       | see plot                         |

**Details**

No details

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

|        |                     |
|--------|---------------------|
| COLORS | <i>color vector</i> |
|--------|---------------------|

---

**Description**

color vector

**Usage**

COLORS

**Format**

An object of class character of length 668.

---

|                 |                                   |
|-----------------|-----------------------------------|
| createExpDesign | <i>Create Experimental Design</i> |
|-----------------|-----------------------------------|

---

**Description**

Create Experimental Design

**Usage**

createExpDesign(tag, nbPlex)

**Arguments**

|        |   |
|--------|---|
| tag    | user input tag e.g. 1,2,3:4,5,6 indicating two condition with 3 reps each |
| nbPlex | tmt 6 or 10 plex  |

**Details**

The first listed condition is always the control condition  
No details

**Value**

expDesign data.frame

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`createExpressionDataset`*Create ExpressionSet object*

---

**Description**

Create ExpressionSet object

**Usage**

```
createExpressionDataset(expressionMatrix = expressionMatrix,  
  expDesign = expDesign, featureAnnotations = featureAnnotations)
```

**Arguments**

|                                 |  |
|---------------------------------|--|
| <code>expressionMatrix</code>   | matrix of expression signals per feature and sample          |
| <code>expDesign</code>          | experimental design data.frame                               |
| <code>featureAnnotations</code> | data.frame including e.g: Protein Description, Id score etc. |

**Details**

```

---

`dotProduct`*Return dotProduct of two vectors*

---

**Description**

Return dotProduct of two vectors

**Usage**

```
dotProduct(u, v, norm = F)
```

**Arguments**

|                   |               |
|-------------------|---------------|
| <code>u</code>    | vector 1      |
| <code>v</code>    | vector 2      |
| <code>norm</code> | dp TRUE/FALSE |

**Value**

dp

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`expDesignTagToExpDesign`*Create experimental design data.frame from user input string*

---

**Description**

Create experimental design data.frame from user input string

**Usage**

```
expDesignTagToExpDesign(tag, expDesignDefault)
```

**Arguments**

|                               |            |
|-------------------------------|------------|
| <code>tag</code>              | tag        |
| <code>expDesignDefault</code> | data.frame |

**Details**

tag: 1,2:3:4,5,6 condition isControl 1 Condition 1 TRUE 2 Condition 1 TRUE 3 Condition 1 TRUE  
4 Condition 2 FALSE 5 Condition 2 FALSE 6 Condition 2 FALSE

**Value**

data.frame describing experimental design

**Note**

|-----------------|---|

---

**Description**

Calculates identification level q-values based on target-decoy score distributions

**Usage**

```
getIdLevelQvals(scores, isDecoy)
```

**Arguments**

|         |                                     |
|---------|-------------------------------------|
| scores  | peptide/protein identificationscore |
| isDecoy | vector of TRUE/FALSE                |

**Details**

$q\text{-value} = (\text{Nb. Decoy Entries at idScore Threshold } S^*) / (\text{Nb. Target Entries at idScore Threshold } S)$ . (\* idScore  $\geq S$ )

**Value**

vector of q.values

---

`getModifProteinCoordinates`*Get modification coordinates on protein*

---

**Description**

Get modification coordinates on protein

**Usage**

```
getModifProteinCoordinates(modifAnnot, peptideSeq, proteinSeq, format = 1)
```

**Arguments**

|                         |  |
|-------------------------|--|
| <code>modifAnnot</code> | modification as annotated by progenesis. E.g. '[15] Phospho (ST)[30] Phospho (ST)' |
| <code>peptideSeq</code> | peptide sequence   |
| <code>proteinSeq</code> | protein sequence   |
| <code>format</code>     | c(1,2) 1. progenesis 2. scaffold   |

**Details**

NA

**Value**

vector of protein coordinates (mmodification residue number)

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

|           |  |
|-----------|--|
| getMotifX | <i>Create motif-x peptide annotation</i> |
|-----------|--|

---

**Description**

Create motif-x peptide annotation

**Usage**

```
getMotifX(modifPos, peptide, proteinSeq, motifLength = 4)
```

**Arguments**

|             |                         |
|-------------|-------------------------|
| modifPos    | vector positions        |
| peptide     | peptide sequence        |
| proteinSeq  | protein sequence        |
| motifLength | motif flanking sequence |

**Details**

motif-x example PGDYS\*TTPG

**Value**

vector of motifs

**Note**

No note

**References**

NA

**Examples**

```
print("No examples")
```

---

`getNbDetectablePeptides`*Get number peptides passing defined length criteria*

---

**Description**

Get number peptides passing defined length criteria

**Usage**

```
getNbDetectablePeptides(peptides, peptideLength = c(5, 36))
```

**Arguments**

|                            |  |
|----------------------------|--|
| <code>peptides</code>      | list of peptides                                     |
| <code>peptideLength</code> | vector of two integers defining peptide length range |

**Details**

No details

**Value**

integer corresponding to number of detectable peptides

**Note**

No note

**Examples**

```
print("No examples")
```

---

`getNbMisCleavages`*Get number of mis-cleavages perp peptide*

---

**Description**

Get number of mis-cleavages perp peptide

**Usage**

```
getNbMisCleavages(peptide, protease = "trypsin")
```

**Arguments**

|                       |                    |
|-----------------------|--------------------|
| <code>peptide</code>  | character vector   |
| <code>protease</code> | regular expression |

**Details**

NA

**Value**

vector of integers

**Note**

No note

|------------------|---|
| getRTNormFactors | <i>Get retentiontime base normalization factors</i> |
|------------------|---|

---

**Description**

Get retentiontime base normalization factors

**Usage**

```
getRTNormFactors(eset, minFeaturesPerBin = 100)
```

**Arguments**

|                   |  |
|-------------------|--|
| eset              | ExpressionSet  |
| minFeaturesPerBin | minumum number of features per bin. If nb. features are < minFeaturesPerBin<br>-> include neighbouring bins. |

**Details**

No details

**Value**

data.frame normalization factors per retention time bin (minute)

**Note**

No note

getTopX

*Calculate Mean of X most intense features*

---

**Description**

Calculate Mean of X most intense features

**Usage**

```
getTopX(entryData, topX = 3)
```

**Arguments**

|           |   |
|-----------|---|
| entryData | data.frame listing feature intensities of one entry. Typically rows corresponds to Peptide entries of one protein |
| topX      | best X flyers   |

**Details**

No details

**Value**

vector of topX intensities per column (sample)

**Note**

No note

```

---

|        |  |
|--------|--|
| rollUp | <i>Roll up feature intensities per unique column combination</i> |
|--------|--|

---

**Description**

Roll up feature intensities per unique column combination

**Usage**

```
rollUp(eset, method = "sum", featureDataColumnName = c("proteinName"))
```

**Arguments**

eset                      ExpressionSet  
 method                    "sum", "mean" or "top3"  
 featureDataColumnName  
                              vector of column names e.g. peptide or proteinName

**Details**

featureDataColumnName = c("peptide","charge","ptm"), method= c("sum"), sums up intensities per peptie modification charge state

**Value**

ExpressionSet object

**Note**

print("No examples")
```

---

|             |  |
|-------------|--|
| rtNormalize | <i>Normalization data per retention time bin</i> |
|-------------|--|

---

**Description**

Normalization data per retention time bin

**Usage**

```
rtNormalize(eset, rtNormFactors)
```

**Arguments**

eset                      ExpressionSet  
 rtNormFactors      obtained using getRTNormFactors

**Details**

Normalize for variations in elelctrospray ionization current.

**Value**

data.frame normalization factors per retention time bin (minute)

`stripACs`*strip uniprot format e.g. "sp|Q8CHJ2|AQP12\_MOUSE" -> Q8CHJ2*

---

**Description**

strip uniprot format e.g. "sp|Q8CHJ2|AQP12\_MOUSE" -> Q8CHJ2

**Usage**

```
stripACs(acs)
```

**Arguments**

`acs`                      accession numbers

**Details**

TRUE if less than 10

**Value**

vector character

**Note**

No note
