# Package 'SafeQuant'

September 27, 2017

Type Package
Title A Toolbox for the Analysis of Proteomics Data
Version 2.3.3
Author Erik Ahrne
Maintainer Erik Ahrne <erik.ahrne@unibas.ch></erik.ahrne@unibas.ch>
<b>Description</b> Tools for the statistical analysis and visualization of (relative and absolute) quantitative (LFQ,TMT,HRM) Proteomics data.
Imports limma, gplots, seqinr, corrplot, optparse, epiR, Biobase, ggplot2, ggrepel, magrittr, Hmisc, pcaMethods, impute, dplyr, GO.db, UniProt.ws, data.table, affy
License GPL-3
RoxygenNote 6.0.1

addIdQvalues	Add identifico target-decoy	-	pressionSe	et (calculat	ted based of	n

# Description

Add identification leve q-values to ExpressionSet (calculated based on target-decoy score distribution)

### Usage

```
addIdQvalues(eset = eset)
```

#### **Arguments**

eset

ExpressionSet

#### **Details**

if ptm column is part if the ExpressionSet q-values are calculated seperately for modified and non-modified features

No details

### Value

ExpressionSet object

### Note

No note

#### See Also

```
getIdLevelQvals
```

### **Examples**

```
print("No examples")
```

 ${\tt addScaffoldPTMFAnnotations}$ 

Add scaffold ptm annotaitons to tmt experiment

# Description

Add scaffold ptm annotaitons to tmt experiment

### Usage

```
addScaffoldPTMFAnnotations(eset, file)
```

### **Arguments**

eset ExpressionSet file path to Scaffold file

### Value

ExpressionSet object

barplotMSSignal 5

#### Note

No note

### References

No references

#### **Examples**

```
print("No examples")
```

barplotMSSignal

Barplot of ms-signal per column

### Description

Barplot of ms-signal per column

### Usage

```
barplotMSSignal(eset,
  col = as.character(.getConditionColors(eset)[pData(eset)$condition, ]),
  method = c("sum", "sharedSignal"), cex.lab = 1.25, cex.axis = 1.25,
  cex.names = 0.9, labels = rownames(pData(eset)), ...)
```

# **Arguments** eset

```
col default condition colors
method c("median","sum","sharedSignal")
cex.lab default 1.25
cex.axis default 1.25
cex.names default 0.9
labels labels
... see plot
```

expressionSet

### **Details**

No details

#### Note

No note

#### References

NA

```
print("No examples")
```

6 createExpDesign

**COLORS** 

color vector

### Description

color vector

### Usage

**COLORS** 

### **Format**

An object of class character of length 668.

createExpDesign

Create Experimental Design

### Description

Create Experimental Design

### Usage

```
createExpDesign(tag, nbPlex)
```

### **Arguments**

tag user input tag e.g. 1,2,3:4,5,6 indicating two condition with 3 reps each

nbPlex tmt 6 or 10 plex

#### **Details**

The first listed condition is always the control condition

No details

#### Value

expDesign data.frame

#### Note

No note

#### References

NA

```
print("No examples")
```

create Expression Dataset

Create ExpressionSet object

### Description

Create ExpressionSet object

### Usage

```
createExpressionDataset(expressionMatrix = expressionMatrix,
  expDesign = expDesign, featureAnnotations = featureAnnotations)
```

### Arguments

expressionMatrix

matrix of expression signals per feature and sample

expDesign

experimental design data.frame

 $feature \verb|Annotations|$ 

data.frame including e.g: Protein Description, Id score etc.

#### **Details**

No details

#### Value

ExpressionSet object

#### Note

No note

### References

NA

### See Also

ExpressionSet

```
print("No examples")
```

createPairedExpDesign Create Paired Expdesign

# Description

Create Paired Expdesign

### Usage

createPairedExpDesign(eset)

### Arguments

eset

ExpressionSet

### **Details**

Add subject colum to phenoData design data.frame

### Value

ExpressionSet object

#### Note

No note

#### References

NA

### See Also

ExpressionSet

```
print("No examples")
```

cvBoxplot 9

cvBoxplot	C.V. boxplot
CVDOXPIOL	c.v. $boxpioi$

### Description

C.V. boxplot

### Usage

```
cvBoxplot(eset,
  col = as.character(.getConditionColors(eset)[unique(pData(eset)$condition),
  ]), cex.names = 0.9, cex.axis = 1.25, cex.lab = 1.25,
  ylab = "C.V. (%)", ...)
```

### **Arguments**

eset	ExpressionSet
col	col
cex.names	default 0.9
cex.axis	default 1.25
cex.lab	default 1.25
ylab	C.V.
	see plot

### **Details**

No details

### Note

No note

### References

NA

```
print("No examples")
```

10 dotProduct

cysteinFreqBarplot

Plot Cystein Frequency

### Description

Plot Cystein Frequency

#### Usage

```
cysteinFreqBarplot(peptides, ...)
```

### **Arguments**

peptides vector ... see plot

#### **Details**

Selecting for peptides of length 7-19

### Note

No note

### References

NA

### **Examples**

```
print("No examples")
```

dotProduct

Return dotProduct of two vectors

### Description

Return dotProduct of two vectors

### Usage

```
dotProduct(u, v, norm = F)
```

# Arguments

u vector 1 v vector 2

norm dp TRUE/FALSE

#### Value

dp

#### Note

No note

#### References

NA

### **Examples**

```
print("No examples")
```

expDesignTagToExpDesign

Create experimental design data.frame from user input string

### **Description**

Create experimental design data.frame from user input string

### Usage

```
expDesignTagToExpDesign(tag, expDesignDefault)
```

### Arguments

```
\begin{array}{c} \text{tag} & \text{tag} \\ \text{expDesignDefault} \\ & \text{data.frame} \end{array}
```

### **Details**

tag: 1,2:3:4,5,6 condition is Control 1 Condition 1 TRUE 2 Condition 1 TRUE 3 Condition 1 TRUE 4 Condition 2 FALSE 5 Condition 2 FALSE 6 Condition 2 FALSE

### Value

data.frame describing experimental design

#### Note

No note

#### References

NA

```
print("No examples")
```

export

Export content of safeQuantAnalysis object

### Description

Export content of safeQuantAnalysis object

#### Usage

```
export(sqa, nbRows = nrow(sqa$pValue), file = NA)
```

#### **Arguments**

sqa safeQuantAnalysis object

nbRows Number of rows to export. Features are ordred by increasing minimal p.value

file file path

#### **Details**

NA

#### Note

No note

#### References

NA

#### See Also

```
{\it safeQuantAnalysis}
```

### **Examples**

```
print("No examples")
```

```
{\tt getAAProteinCoordinates}
```

Get amino acid coordinates on protein

### Description

Get amino acid coordinates on protein

#### Usage

```
getAAProteinCoordinates(peptideSeq, proteinSeq, aaRegExpr = "[STY]")
```

getAccessionNumber 13

#### **Arguments**

peptideSeq peptide sequence proteinSeq protein sequence aaRegExpr target AA reg exp

#### **Details**

NA

#### Value

vector of protein coordinates (mmodification residue number)

#### Note

No note

#### References

NA

### **Examples**

```
print("No examples")
```

getAccessionNumber

Extract accession numbers from Uniprot proteinNames

### **Description**

Extract accession numbers from Uniprot proteinNames

### Usage

```
getAccessionNumber(proteinName)
```

### **Arguments**

proteinName vector of protein names

#### **Details**

```
sp|A0MZ66|SHOT1_HUMAN -> A0MZ66
```

#### Value

vector of uniprot accession numbers

#### Note

No note

14 getAllCV

### **Examples**

```
print("No examples")
```

getAllCV

Calculate Coefficiant of Variance per feature (Relative standard Deviation) per Condition

# Description

Calculate Coefficiant of Variance per feature (Relative standard Deviation) per Condition

### Usage

```
getAllCV(eset)
```

# Arguments

eset

ExpressionSet

### **Details**

```
CV = sd / mean
```

### Value

data.frame of CVs per condition

#### Note

No note

### References

NA

### See Also

getCV

```
print("No examples")
```

getAllDotProduct 15

getAllDotProduct

Return dotProducts to most transition intensities of most intense runs

#### **Description**

Return dotProducts to most transition intensities of most intense runs

### Usage

```
getAllDotProduct(eset, nbRefRuns = 4)
```

#### **Arguments**

eset ExpressionSet nbRefRuns (default top 4)

#### Value

dp

#### Note

No note

### References

NA

### **Examples**

```
print("No examples")
```

getAllEBayes

Perform statistical test (mderated t-test), comparing all case to control

#### **Description**

Perform statistical test (mderated t-test), comparing all case to control

#### Usage

```
getAllEBayes(eset = eset, adjust = F, log = T, method = "pairwise",
   adjustFilter = matrix(F, nrow = nrow(eset), ncol =
   length(levels(pData(eset)$condition)) - 1))
```

16 getBaselineIntensity

### **Arguments**

eset ExpressionSet

adjust TRUE/FALSE adjust for multiple testing using Benjamini & Hochberg (1995)

method

log T/F log-transform expression values

method c("all", "pairwise")

adjustFilter matrix T/F do not adjust for multiple testing

#### **Details**

No details

#### Value

data.frame of pvalues per condition comparison

#### Note

No note

#### References

Empirical Bayes method, Smyth (2004), http://www.ncbi.nlm.nih.gov/pubmed/16646809

#### See Also

eBayes

#### **Examples**

```
print("No examples")
```

getBaselineIntensity Get signal at zscore x (x standard deviations below mean)

#### **Description**

Get signal at zscore x (x standard deviations below mean)

### Usage

```
getBaselineIntensity(intensities, promille = 5)
```

### Arguments

intensities refrence run signals

promille baseline value set as specified promille

#### Value

baseline value

getCV 17

#### Note

No note

### References

NA

### **Examples**

```
print("No examples")
```

getCV

Calculate Coefficiant of Variance per feature (Relative standard Deviation)

# Description

Calculate Coefficiant of Variance per feature (Relative standard Deviation)

### Usage

getCV(data)

### **Arguments**

data

data.frame of replicate signals

## **Details**

CV = sd / mean

### Value

vector of CVs

### Note

No note

### References

NA

```
print("No examples")
```

```
{\tt getExpDesignProgenesisCsv}
```

Parse Experimental Design from Progenesis Csv Export

# Description

Parse Experimental Design from Progenesis Csv Export

### Usage

```
getExpDesignProgenesisCsv(file,
  expressionColIndices = .getProgenesisCsvExpressionColIndices(file))
```

### Arguments

```
\begin{tabular}{ll} file & path to progenesis csv file \\ expressionColIndices \\ & default .getProgenesisCsvExpressionColIndices(file) \\ \end{tabular}
```

#### **Details**

No details

### Value

data.frame describing experimental design

### Note

No note

#### References

NA

```
print("No examples")
```

getFTestPValue 19

getFTestPValue

Perform statistical test (mderated F-test)

### Description

Perform statistical test (mderated F-test)

### Usage

```
getFTestPValue(eset, adjust = F, log = T)
```

### Arguments

eset ExpressionSet

adjust TRUE/FALSE adjust for multiple testing using Benjamini & Hochberg (1995)

method

log T/F log-transform expression values

### **Details**

No details

#### Value

list of pvalues

### Note

No note

#### References

Empirical Bayes method, Smyth (2004), http://www.ncbi.nlm.nih.gov/pubmed/16646809

### See Also

eBayes

```
print("No examples")
```

getGeneName

Extract Gene Name from uniprot fasta header description

### Description

Extract Gene Name from uniprot fasta header description

#### Usage

```
getGeneName(proteinDescription)
```

### Arguments

```
\begin{tabular}{ll} \textbf{proteinDescription} \\ \textbf{vector of descriptions} \\ \end{tabular}
```

#### **Details**

ATP synthase subunit beta OS=Salmonella typhimurium (strain SL1344) GN=atpD -> atpD

#### Value

vector of gene names

#### Note

No note

#### **Examples**

```
print("No examples")
```

 ${\tt getGlobalNormFactors}$ 

Get normalization factors. calculated as summed/median signal per run (column) over summed/median of first run.

#### **Description**

Get normalization factors. calculated as summed/median signal per run (column) over summed/median of first run.

#### Usage

```
getGlobalNormFactors(eset, method = "median")
```

#### **Arguments**

 $\begin{array}{ll} \text{eset} & \text{ExpressionSet} \\ \text{method} & \text{c("sum","median)} \end{array}$ 

getGoTermDF 21

#### **Details**

No details

#### Value

vector of normalization factors

#### Note

No note

#### References

NA

### **Examples**

```
print("No examples")
```

getGoTermDF

Get Go term data for a list of uniprot accession numbers

### Description

Get Go term data for a list of uniprot accession numbers

### Usage

```
getGoTermDF(taxId = taxId, acs = acs)
```

### Arguments

taxId uniprot taxon identifier

acs vector uniprot accession numbers

### **Details**

NA

#### Value

```
data.frame "UNIPROTKB" "GO-ID" "ccIds" "mfIds" "bpIds" "ccTerms" "mfTerms" "bpTerms"
```

#### Note

No note

### References

NA

22 getIBAQEset

#### See Also

NA

#### **Examples**

```
print("No examples")
```

getIBAQEset

Calculate intensity-based absolute-protein-quantification (iBAQ) metric per protein

#### **Description**

Calculate intensity-based absolute-protein-quantification (iBAQ) metric per protein

#### Usage

```
getIBAQEset(eset, proteinDB = NA, peptideLength = c(5, 36),
   nbMiscleavages = 0, proteaseRegExp = .getProteaseRegExp("trypsin"))
```

#### **Arguments**

eset protein level ExpressionSet

proteinDB list protein sequneces

peptideLength peptide length interval (to get number of peptides used for normalization)
nbMiscleavages number of mis-cleavages allowed when digesting protein sequences in silico (to

get number of peptides used for normalization)

proteaseRegExp protease Reg Exp cleavage rule

### Details

No details

#### Value

ExpressionSet

#### Note

No note

### References

Global quantification of mammalian gene expression control, Schwanhausser (2011), http://www.ncbi.nlm.nih.gov/pubmed/21593866, Critical assessment of proteome-wide label-free absolute abundance estimation strategies. Ahrne (2013), http://www.ncbi.nlm.nih.gov/pubmed/23794183

```
print("No examples")
```

getIdLevelQvals 23

 ${\tt getIdLevelQvals}$ 

Calculates identification level q-values based on target-decoy score distributions

### Description

Calculates identification level q-values based on target-decoy score distributions

### Usage

```
getIdLevelQvals(scores, isDecoy)
```

### **Arguments**

scores peptide/protein identficationscore

isDecoy vector of TRUE/FALSE

### **Details**

```
q-value = (Nb. Decoy Entries at idScore Threshold S^*) / (Nb. Target Entries at idScore Threshold S). (* idScore >= S)
```

#### Value

vector of q.values

#### Note

No note

#### References

NA

#### **Examples**

```
print("No examples")
```

 ${\tt getImpuritiesMatrix}$ 

Get Thermo TMT impurity matrix

### Description

Get Thermo TMT impurity matrix

#### Usage

```
getImpuritiesMatrix(plexNb = 6)
```

24 getImputationMatrix

### **Arguments**

plexNb integer, 6 or 10 plex

#### **Details**

No details

#### Value

impurity matrix matrix

#### Note

No note

#### References

NA

#### **Examples**

```
print("No examples")
```

 ${\tt getImputationMatrix}$ 

Get matrix of imputed valeus in ExpressionSet matrix

### Description

Get matrix of imputed valeus in ExpressionSet matrix

### Usage

```
getImputationMatrix(eset, method = "intensity")
```

### **Arguments**

eset ExpressionSet

method c("intensity", "count") default intensity

# Value

matrix

#### Note

No note

### See Also

No note

```
print("No examples")
```

getIntSumPerProtein 25

getIntSumPerProtein Sum up raw intensities per protein and channel. keep track of number of summed spectra and unique peptides

### Description

Sum up raw intensities per protein and channel. keep track of number of summed spectra and unique peptides

### Usage

```
getIntSumPerProtein(intData, proteinACs, peptides, minNbPeptPerProt = 1)
```

### Arguments

intData data.frame of intensities per channel proteinACs vector of protein accession numbers

peptides vector of peptide sequneces

minNbPeptPerProt

minimal number of peptides per protein

## Details

NA

No details

#### Value

list containing 3 objects 1) data.frame of channel intensities per protein ac, 2) vector listing number of summed spectra per protein, 3) vector listing number of summed peptides per protein

#### Note

No note

#### References

NA

```
print("No examples")
```

26 getKinaseFreq

getKinaseFreq

Get kinase matching frequnecy of each phospho peptide subsequnece

# Description

Get kinase matching frequnecy of each phospho peptide subsequnece

### Usage

```
getKinaseFreq(phosphoSeqs)
```

### Arguments

phosphoSeqs

vector of phospho peptide sub sequneces 'PARVVRpSRREEEE'

### **Details**

NA

### Value

ExpressionSet object

#### Note

No note

#### References

NA

### See Also

NA

```
print("No examples")
```

getKinases 27

getKinases

Get all kinases matching phospho peptide sub sequnece

# Description

Get all kinases matching phospho peptide sub sequnece

### Usage

```
getKinases(phosphoSeq)
```

### Arguments

phosphoSeq scalar peptide sub sequnece 'PARVVRpSRREEEE'

### **Details**

NA

### Value

ExpressionSet object

#### Note

No note

#### References

NA

### See Also

NA

```
print("No examples")
```

28 getLoocvFoldError

getLOD

Return dilution curve limit of detection

### Description

Return dilution curve limit of detection

#### Usage

```
getLOD(dCurve, method = "blank")
```

### Arguments

dCurve data.frame

method c("blank","low")

#### Value

lod

#### Note

No note

#### References

NA

### **Examples**

```
print("No examples")
```

getLoocvFoldError

Leave-One-Out Cross Validate Qunatification Model

### Description

Leave-One-Out Cross Validate Qunatification Model

# Usage

```
getLoocvFoldError(df)
```

#### **Arguments**

df

data.frame of two columns 1) "signal" - ms metric 2) "cpc" absolute quantity

### **Details**

No details

getMaxIndex 29

#### Value

data.frame of fold errors per (left-out) protein

#### Note

No note

### References

NA

#### See Also

NA

### **Examples**

```
print("No examples")
```

getMaxIndex

get index of max in vecotor of numeric values

### Description

get index of max in vecotor of numeric values

### Usage

```
getMaxIndex(v)
```

### **Arguments**

٧

vector

getMeanCenteredRange (

Get modification coordinates on protein

### **Description**

Get modification coordinates on protein

#### Usage

```
getMeanCenteredRange(d, nbSd = 4)
```

### Arguments

d numeric vector

nbSd range spanning number of sd frmo mean

#### **Details**

NA

#### Value

vector range boundries

#### Note

No note

#### References

NA

#### **Examples**

```
print("No examples")
```

```
getModifProteinCoordinates
```

Get modification coordinates on protein

### Description

Get modification coordinates on protein

### Usage

```
getModifProteinCoordinates(modifAnnot, peptideSeq, proteinSeq, format = 1)
```

### Arguments

modifannot modification as annotated by progenesis. E.g. '[15] Phospho (ST)|[30] Phospho

(ST)'

peptideSeq peptide sequence
proteinSeq protein sequence

format c(1,2) 1. progenesis 2. scaffold

### **Details**

NA

### Value

vector of protein coordinates (mmodification residue number)

#### Note

No note

getMotifFreq 31

#### References

NA

### **Examples**

```
print("No examples")
```

getMotifFreq

Get motif matching frequnecy of each phospho peptide subsequnece

### Description

Get motif matching frequnecy of each phospho peptide subsequnece

### Usage

```
getMotifFreq(phosphoSeqs)
```

### Arguments

phosphoSeqs

vector of phospho peptide sub sequneces 'PARVVRpSRREEEE'

### **Details**

NA

### Value

ExpressionSet object

### Note

No note

# References

NA

### See Also

NA

```
print("No examples")
```

32 getMotifX

getMotifX

Create motif-x peptide annotation

# Description

Create motif-x peptide annotation

### Usage

```
getMotifX(modifPos, peptide, proteinSeq, motifLength = 4)
```

# Arguments

modifPos vector positions

peptide peptide sequence

proteinSeq protein sequence

motifLength motif flanking sequence

#### **Details**

motif-x example PGDYS\*TTPG

#### Value

vector of motifs

#### Note

No note

#### References

NA

```
print("No examples")
```

getNAFraction 33

getNAFraction

Get fraction missing values per ratio/condition/run

### Description

Get fraction missing values per ratio/condition/run

#### Usage

```
getNAFraction(eset, method = c("ratio", "intensity"))
```

#### **Arguments**

eset ExpressionSet

method c("ratio","cond","run","count","intensity")

#### Value

matrix

#### Note

No note

#### See Also

No note

### **Examples**

```
print("No examples")
```

getNbDetectablePeptides

Get number peptides passing defined length criteria

# Description

Get number peptides passing defined length criteria

### Usage

```
getNbDetectablePeptides(peptides, peptideLength = c(5, 36))
```

### Arguments

peptides list of peptides

peptideLength vector of two integers defining peptide length range

34 getNbMisCleavages

#### **Details**

No details

#### Value

integer corresponding to number of detectable peptides

#### Note

No note

### **Examples**

```
print("No examples")
```

getNbMisCleavages

Get number of mis-cleavages perp peptide

### Description

Get number of mis-cleavages perp peptide

### Usage

```
getNbMisCleavages(peptide, protease = "trypsin")
```

### **Arguments**

peptide character vector protease regular expression

### **Details**

NA

#### Value

vector ofintegers

## Note

No note

#### References

NA

```
print("No examples")
```

```
{\tt getNbPeptidesPerProtein}
```

Get number of peptides per protein

### Description

Get number of peptides per protein

### Usage

```
getNbPeptidesPerProtein(eset)
```

### **Arguments**

eset

ExpressionSet

### **Details**

NA

#### Value

table

#### Note

No note

#### References

NA

### **Examples**

```
print("No examples")
```

getNbRolledUpFeatures Get number rolled up features per row

### Description

Get number rolled up features per row

### Usage

```
getNbRolledUpFeatures(eset, method = "vector")
```

### Arguments

eset ExpressionSet

method c("vector","matrix") default vector

# Value matrix Note No note See Also No note **Examples** print("No examples") getNbSpectraPerProtein Get number of spectra per protein Description Get number of spectra per protein Usage getNbSpectraPerProtein(eset) **Arguments** ExpressionSet eset **Details** NA Value table Note No note References

NA

**Examples** 

print("No examples")

getPeptides 37

getPeptides

Digest protein

#### **Description**

Digest protein

#### Usage

```
getPeptides(proteinSeq, proteaseRegExp = .getProteaseRegExp("trypsin"),
    nbMiscleavages = 0)
```

## Arguments

```
\begin{array}{ll} {\rm proteinSeq} & {\rm protein\ sequence} \\ {\rm proteaseRegExp} & {\rm protease\ Regular\ Expression} \\ {\rm nbMiscleavages} & {\rm default\ 0} \\ \end{array}
```

#### **Details**

No details

#### Value

vector of peptides

#### Note

No note

## **Examples**

```
print("No examples")
```

getRatios

Calculate ratios, comparing all case to control

## Description

Calculate ratios, comparing all case to control

#### Usage

```
getRatios(eset, method = "median", log2 = T)
```

# Arguments

eset ExpressionSet

method median, mean, paired

log2 transform

38 getRTNormFactors

#### **Details**

No details

#### Value

ExpressionSet object

#### Note

No note

#### References

NA

## **Examples**

```
print("No examples")
```

 ${\tt getRTNormFactors}$ 

Get retentiontime base normalization factors

# Description

Get retentiontime base normalization factors

## Usage

```
getRTNormFactors(eset, minFeaturesPerBin = 100)
```

# Arguments

eset

ExpressionSet

 ${\tt minFeaturesPerBin}$ 

minumum number of features per bin. If nb. features are < minFeaturesPerBin -> include neighbouring bins.

#### **Details**

No details

#### Value

data.frame normalization factors per retention time bin (minute)

## Note

No note

getScoreCutOff 39

#### References

In Silico Instrumental Response Correction Improves Precision of Label-free Proteomics and Accuracy of Proteomics-based Predictive Models, Lyutvinskiy et al. (2013), http://www.ncbi.nlm.nih.gov/pubmed/23589346

## **Examples**

```
print("No examples")
```

getScoreCutOff

Get score cutoff for a given fdr cut-off

# Description

Get score cutoff for a given fdr cut-off

## Usage

```
getScoreCutOff(scores, isDecoy, fdrCutOff = 0.01)
```

## **Arguments**

scores peptide/protein identficationscore

 $is {\tt Decoy} \qquad \quad vector\ of\ TRUE/{\tt FALSE}$ 

fdrCutOff [0,1]

#### **Details**

NA

#### Value

scoreCutoff

#### Note

No note

#### References

NA

```
print("No examples")
```

40 getSwaths

getSignalPerCondition Summarize replicate signal per condition (min)

## Description

Summarize replicate signal per condition (min)

#### Usage

```
getSignalPerCondition(eset, method = "median")
```

## Arguments

eset ExpressionSet

method median (default), mean, max, min, sd, sum

#### **Details**

No details

#### Value

data.frame of per condition signals

# Note

No note

#### References

NA

## **Examples**

```
print("No examples")
```

getSwaths

get swath sizes ensuring equal number of precurosrs per swath

## Description

get swath sizes ensuring equal number of precurosrs per swath

```
getSwaths(mzs, nbSwaths = 30, lowerOverlap = 2)
```

getTopX 41

#### **Arguments**

mzs precuersor mz values

nbSwaths default 30

lowerOverlap default 2 lower bound overlap preceeding window

## **Details**

No details

#### Value

```
data.frame "binMean", "lower", "upper", "delta"
```

#### Note

No note

#### References

No ref

## **Examples**

```
print("No examples")
```

getTopX

Calculate Mean of X most intense features

# Description

Calculate Mean of X most intense features

## Usage

```
getTopX(entryData, topX = 3)
```

# Arguments

entryData data.frame listing feature intensities of one entry. Typically rows corresponds to

Peptide entries of one protein

topX best X flyers

#### **Details**

No details

## Value

vector of topX intensities per column (sample)

ggDilutionCurve 43

ggDilutionCurve

Plot dilution curve

#### **Description**

Plot dilution curve

#### Usage

```
ggDilutionCurve(dCurve, lod, title = "")
```

#### **Arguments**

dCurve data.frame columns concentration, intensity

lod limit of detection

title plot title

#### Value

ggplot2

#### Note

No note

#### References

NA

#### **Examples**

```
print("No examples")
```

ggVolcanoPlot

Plots volcano, data points colored by max cv of the 2 compared conditions

#### **Description**

Plots volcano, data points colored by max cv of the 2 compared conditions

```
ggVolcanoPlot(data = data, title = "", pValueThrs = 0.05,
  log2RatioThrs = 0.5849625, thrsLineCol = "lightgrey", thrsLineLty = 2,
  xlab = "log2 ratio", ylab = "-log10 pValue", textSize = 20,
  xlim = range(data$ratio, na.rm = T), ylim = range(-log10(data$pValue),
  na.rm = T), abline = c("both"), topNlabels = 10)
```

44 globalNormalize

#### **Arguments**

data data.frame

title default no title

pValueThrs default 0.01

log2RatioThrs default log2(0.5)

thrsLineCol default "lightgrey"

xlab default "log2 ratio"

ylab default "-log10 pValue"

textSize default 20 xlim xlim ylim ylim

abline c("none","both","ratio","pvalue")

topNlabels default 10, label top proteins/peptides ordered by p-value

defalut 2

#### **Details**

data.frame input object should contain columns ("ratio", "pValue", "geneName", "ac", "cv", "description")

#### Value

ggplot2 object

#### Note

No note

#### References

NA

## **Examples**

```
print("No examples")
```

globalNormalize

Normalize, Norm factors calculated as median signal per run (column) over median of first run.

## Description

Normalize, Norm factors calculated as median signal per run (column) over median of first run.

```
globalNormalize(eset, globalNormFactors)
```

hClustHeatMap 45

#### **Arguments**

```
eset ExpressionSet globalNormFactors globalNormFactors
```

#### **Details**

No details

#### Value

eset ExpressionSet

#### Note

No note

#### References

NA

#### See Also

getGlobalNormFactors

#### **Examples**

```
print("No examples")
```

hClustHeatMap

Hierarchical clustering heat map, cluster by runs intensity, features by ratio and display log2 ratios to control median

## Description

Hierarchical clustering heat map, cluster by runs intensity, features by ratio and display log2 ratios to control median

#### Usage

```
hClustHeatMap(eset, conditionColors = .getConditionColors(eset),
  breaks = seq(-2, 2, length = 20), dendogram = "column",
  legendPos = "left", ...)
```

#### **Arguments**

eset ExpressionSet

 ${\tt conditionColors}$ 

data.frame of colors per condition

breaks default seq(-2,2,length=20) dendogram see heatmap.2 gplots

legendPos see legend ... see plot

46 isCon

#### **Details**

No details

#### Note

No note

#### References

NA

# Examples

```
print("No examples")
```

isCon

Check if protein is a contaminant entry

# Description

Check if protein is a contaminant entry

## Usage

isCon(ac)

# **Arguments**

ac

vector of protein accession numbers

## **Details**

contanminants proteins are typically annotated as: CON\_P0000

#### Value

vector TRUE/FALSE

#### Note

No note

## References

NA

```
print("No examples")
```

isDecoy 47

isDecoy

Check if protein is a decoy entry

## Description

Check if protein is a decoy entry

## Usage

isDecoy(ac)

#### **Arguments**

ac

vector of protein accession numbers

#### **Details**

decoy proteins are typically annotated as: REV\_P0000

#### Value

vector TRUE/FALSE

#### Note

No note

#### References

NA

## **Examples**

print("No examples")

 $is {\tt StrippedACs}$ 

 $\label{lem:check} \begin{tabular}{lll} Check & if & ACs & are & in & "non-stripped" & uniprot & format & e.g. \\ "sp|Q8CHJ2|AQP12\_MOUSE" & & & \\ \end{tabular}$ 

## Description

Check if ACs are in "non-stripped" uniprot format e.g. "splQ8CHJ2|AQP12\_MOUSE"

## Usage

```
isStrippedACs(acs)
```

## **Arguments**

acs

accession numbers

48 kinaseMotif

#### **Details**

TRUE if less than 10

## Value

boolean TRUE/FALSE

#### Note

No note

#### References

NA

# **Examples**

```
print("No examples")
```

kinaseMotif

Kinase motifs

# Description

Human Protein Reference Database Serine/Threonine motifs http://www.hprd.org/serine\_motifs The variables are as follows:

# Usage

kinaseMotif

#### **Format**

A data frame with 175 rows and 2 variables:

motif kinase motif)

kinase kinase

maPlotSQ 49

maPlotSQ  $ma ext{-}plot$ 

## Description

ma-plot

# Usage

```
maPlotSQ(eset, sample = colnames(exprs(eset))[1], cex.lab = 1.5,
  cex.axis = 1.5, lwd = 2, pch = 1, col = rgb(0, 100, 0, 50,
  maxColorValue = 255), ...)
```

## Arguments

eset ExpressionSet
sample selected condition
cex.lab default 1.5
cex.axis default 1.5
lwd default 2
pch default 1
col green transparent
... see plot

Scatter plot with density coloring

#### Usage

```
plotXYDensity(x, y, isFitLm = T, legendPos = "bottomright",
  disp = c("abline", "R", "Rc"), pch = 20, ...)
```

## **Arguments**

```
x number vectory number vectorisFitLm fit linear modellegendPos see legend
```

disp c("abline","R","Rc") display options

pch see plot ... see plot

purityCorrectTMT

Correct channel intensities based on Reporter ion Isotopic Distribu-

# Description

Correct channel intensities based on Reporter ion Isotopic Distributions

#### Usage

```
purityCorrectTMT(tmtData, impurityMatrix = impurityMatrix)
```

# **Arguments**

```
tmtData data.frame containing tmt channel intensities impurityMatrix correction matrix
```

#### **Details**

Same method as MSnbase, and described in Breitwieser et al. 2012 (Book Chapter)

#### Value

data.frame of corrected tmt intensities

#### Note

No note

removeOutliers 73

removeOutliers

Set value to NA if it deviatives with more than 1.5 \* IQR from lower/upper quantile

## Description

Set value to NA if it deviatives with more than 1.5 \* IQR from lower/upper quantile

# Usage

```
removeOutliers(x, na.rm = TRUE, ...)
```

#### **Arguments**

x vector numeric

na.rm logical indicating whether missing values should be removed.

... qunatile args

#### **Details**

No details

```

rollUp

Roll up feature intensites per unique colum combination

## Description

Roll up feature intensites per unique colum combination

```
rollUp(eset, method = "sum", featureDataColumnName = c("proteinName"))
```

74 rollUpDT

#### **Arguments**

eset ExpressionSet

method "sum", "mean" or "top3"

feature Data Column Name

vector of column names e.g. peptide or proteinName

#### **Details**

featureDataColumnName = c("peptide","charge","ptm"), method= c("sum"), sums up intensities per peptie modification charge state

#### Value

ExpressionSet object

#### Note

No note

#### References

No references

#### **Examples**

```
print("No examples")
```

rollUpDT

Roll up feature intensites per unique colum combination

#### **Description**

Roll up feature intensites per unique colum combination

#### Usage

```
rollUpDT(eset, method = "sum", featureDataColumnName = c("proteinName"))
```

# Arguments

eset ExpressionSet

method "sum", "mean" or "top3"

 $feature {\tt Data} {\tt ColumnName}$ 

vector of column names e.g. peptide or proteinName

#### **Details**

featureDataColumnName = c("peptide","charge","ptm"), method= c("sum"), sums up intensities per peptie modification charge state

rtNormalize 75

#### Value

ExpressionSet object

#### Note

No note

No references

# **Examples**

```
print("No examples")
```

rtNormalize

Normalization data per retention time bin

## Description

Normalization data per retention time bin

#### Usage

```
rtNormalize(eset, rtNormFactors)
```

#### **Arguments**

eset ExpressionSet

 ${\tt rtNormFactors} \quad obtained \ using \ getRTNormFactors \\$ 

#### **Details**

Normalize for variations in elelctrospray ionization current.

#### Value

data.frame normalization factors per retention time bin (minute)

#### Note

No note

safeQuantAnalysis

safeQunat s3 class

## Description

```
safeQunat s3 class
```

# Usage

```
safeQuantAnalysis(eset = eset, method = c("global", "naRep", "pairwise"),
  intensityAdjustmentObj = NA, fcThrs = 1)
```

## Arguments

eset ExpressionSet

 $\begin{tabular}{ll} method & c("global","naRep","rt","quantile","pairwise","all") \\ \end{tabular}$ 

intensityAdjustmentObj

list

fcThrs fold change threshold

setNbPeptidesPerProtein

Set nbPeptides coulmn of featureData

# Description

Set nbPeptides coulmn of featureData

#### Usage

```
setNbPeptidesPerProtein(eset)
```

#### **Arguments**

eset

ExpressionSet

# **Details**

NA

#### Value

eset

78 sqImpute

sqImpute

Impute missing values

#### **Description**

Impute missing values

#### Usage

```
sqImpute(eset, method = "gmin")
```

## Arguments

eset ExpressionSet

method c("knn","ppca","gMin",lMin)

#### **Details**

• gMin: half global minimum (0.1 percentile)

lMin: half local minimum gMean: half global mean

• IMean: half local mean

• knn: Nearest neighbour averaging, as implemented in the impute::impute.knn function

• ppca: An iterative method using a probabilistic model to handle missing values, as implemented in the pcaMethods::pca function.

80 stripACs

stripACs

strip uniprot format e.g. "sp\Q8CHJ2\AQP12\_MOUSE" -> Q8CHJ2

# Description

```
strip uniprot format e.g. "splQ8CHJ2lAQP12_MOUSE" -> Q8CHJ2
```

## Usage

```
stripACs(acs)
```

#### **Arguments**

acs

accession numbers

#### **Details**

TRUE if less than 10

#### Value

vector character

#### Note

No note
